(54) CODE EXCITATION LINEAR PREDICTIVE VOICE CODING METHOD AND ITS
DECODING METHOD

(57)Abstract:

PURPOSE: To perform high quality coding with a low bit rate without increasing the number of outgoing bits.

CONSTITUTION: A noise coding book 51-5N is made from a learned voice for each range in which a pitch period of a voice is classified, an input voice is analyzed in linear prediction, a quantization predictive coefficient is set to a coefficient of a synthetic filter 3, segmented with a pitch period from an immediately preceding filter excitation vector in an adaptive coding book 4, and one on the noise coding book 51-5N is selected in accordance with the pitch period. Weighted sum of the noise vector and the segmented adaptive coding vector is made to be an excitation signal of the filter 3 from the noise coding book 51-5N, and the pitch period and the noise vector are

selected so that distortion of a synthesized speech is minimized.

LEGAL STATUS

[Date of request for examination] 15.11.1999

[Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]

[Date of final disposal for application]

[Patent number]

[Date of registration]

[Number of appeal against examiner's decision of rejection]

[Date of requesting appeal against examiner's decision of rejection]

[Date of extinction of right]
